

ENHANCE YOUR SMILE.

When many teeth are loose or extracted, full teeth replacements may have to be fitted to maintain normal chewing, bite (occlusion), speech and the appearance of the upper and lower jaws.

Millions of people worldwide have permanent and temporary replacements. With today's technology, they look more natural and fit better than ever before. These options vastly improve oral health and appearance.

You may want to think about full teeth replacements if:

- There are gaps between your teeth or your teeth are loose and shifting
- You have chronic toothaches
- You have red, swollen, tender or bleeding gums
- You have one or more missing teeth
- You struggle with eating some types of foods
- You often hide your smile because of missing or damaged teeth

Options For Replacing Teeth

Find the best solution to fix your missing teeth.

MintDentalTwinFalls.com

TRADITIONAL DENTURE

The traditional denture looks nice but is very difficult to eat with, especially the lower denture. With implants becoming so mainstream in dentistry, traditional dentures have now become BELOW the standard of care when replacing teeth.

Traditional denture wearers also see a huge loss of gum and bone support in their mouth, which leads to facial drooping, sagging skin, and the appearance of premature aging.

ADVANTAGES:

- Least expensive option
- Can look nice
- Better than nothing

DISADVANTAGES:

- Hard to eat with & moves around a lot
- Can feel very bulky
- Large loss of taste and temperature sensations due to roof of mouth being covered
- Needs to be relined and repaired

\$1,800 *Final Denture*

*+\$752 temporary healing denture (if desired)
Includes all costs except extractions*

IMPLANT SNAP-ON DENTURE

The implant snap-on denture has become our most popular option for patients looking to replace their missing teeth. This denture snaps into place and is much more secure than a traditional denture. The implant snap-on denture is less bulky and doesn't cover the roof of the mouth.

The denture can be removed for easy cleaning. The use of implants also prevents future bone loss, premature aging and facial sagging.

ADVANTAGES:

- Most affordable implant option
- Huge upgrade over traditional dentures
- Prevents bone loss and premature aging
- Improves ability to taste things

DISADVANTAGES:

- Still has some movement
- Comes out at night

\$5,000 or **\$8,500**

for 2 implants

for 4 implants

Includes all costs except extractions

IMPLANT SUPPORTED BRIDGE

A screwed in dental bridge is a full set of upper or lower teeth that is permanently attached to dental implants. The screwed in dental bridge is the closest option we have to the feel and function of the patient's own teeth. The patient will not be able to remove the bridge.

It is designed to only be removed by a dentist once per year. This bridge feels the most natural of all the options available and allows for the best biting and chewing.

ADVANTAGES:

- Made of a very strong material
- Natural feel
- Best biting and chewing function
- Stays in the mouth all the time

DISADVANTAGES:

- Can be difficult to clean
- Will require maintenance over time
- Most expensive option

\$20,000 *per arch*

Includes all costs except extractions
